

MENA Cloud Market Memo - 2026

The MENA cloud computing market continued strong double-digit growth through the first half of 2026, driven by government digital-transformation programs in Egypt, Saudi Arabia, and the UAE. Demand for managed Kubernetes, DevOps automation, and AI inference capacity outpaced supply, pushing several hyperscalers to open new local availability zones.

Key findings: (1) Revenue from platform services grew 34% year over year. (2) Customer churn declined to 3.2% in Q4 as reliability improved. (3) Skills shortages in SRE and MLOps remain the top adoption barrier cited by 61% of surveyed enterprises.

Risks: currency volatility and data-residency regulation could slow cross-border rollouts. Recommendation: prioritize local partnerships and invest in DevOps/SRE talent pipelines to capture the underserved mid-market segment.
